MORE *VISIBILITY,* MORE EFFICIENCIES, *MORE* CAPABILITIES *WITH* AZURE LIGHTHOUSE.

The essentials for Azure NCE partners.

Azure Lighthouse gives partners a single control pane to view and manage Azure at scale across all end customers. This provides a better managed Azure experience with higher automation and efficiency, resulting in greater visibility and security for customers.

WITH AZURE LIGHTHOUSE, PARTNERS CAN STREAMLINE ENGAGEMENT AND MANAGEMENT.

- Manage Azure resources for each customer securely from within your own Azure tenant.
- View cross-tenant information without switching from one tenant to the next when managing multiple customers.
- Use Azure Resource Management templates to onboard customer resources and facilitate cross-tenant management tasks

With Azure Lighthouse, you can now request customer permission to manage various parts of their environment using your own set of credentials. Once they grant you this permission, you'll be able to stay logged into the Azure portal with your own username and have visibility and control over multiple customers' tenants, subscriptions, resource groups and resources to manage them at scale.

BENEFITS

- Allow MSPs to focus on their core expertise and set a more **profitable** path.
- Provide MSPs the capability of cross-tenant management at scale to **differentiate** and benefit from greater efficiency and automation.
- Support MSPs controlling their AOBO (Admin on Behalf of) and secure their X% earned credits. Customers tend to be more flexible in providing partner AOBO when access is granted via Azure Lighthouse.
- Allow to build cross-tenant experiences with minimal development.
- MSPs and ISVs can extend and serve up their IP natively within Azure using custom providers.

WHAT IS AZURE LIGHTHOUSE?

Azure Lighthouse lets MSPs perform management operations including subscriptions, resource groups, and individual resources, on behalf of end customers. It extends Azure Resource Manager with delegated resource management and enables MSPs to manage at scale and efficiently build and deliver managed services.

WHAT MORE CAN YOU DO WITH AZURE LIGHTHOUSE?

Azure Lighthouse enables MSPs to do some exciting things, including:

CENTRALIZING SECURITY POLICIES:

Be much more efficient, automated, and less error prone. Have a centralized set of security policies that you create and manage, and can apply to all, or to a delegated set of customers, at once.

PATCHING POLICIES:

View and act on Update Management events across all customers in one place, instead of individually applying it to each tenant.

PORTAL, REST API, CLI, POWERSHELL:

Create limitless possibilities for automation software to work efficiently across large customer bases. Azure Lighthouse enables developers and engineers to create software solutions and scripts using all of Azure's management capabilities, such as CLI, RestAPI, and PowerShell to manage all aspects of customers' environment.

When Azure as a platform does more for our partners, our partners can focus on providing differentiated services and higher value to our joint customers leveraging Azure Lighthouse at no additional cost.
